

00 Cover - Roadmap Scope

LunaCrypto Research Workstation

Logged-in AI crypto research workstation. The browser talks only to the NestJS API, research artifacts stay inspectable, and the product never presents itself as an execution terminal.

- Market context
- Deterministic signals
- Multi-agent research
- Structured thesis
- User journal

Non-negotiable product rules

P0

Every thesis screen shows evidence, contradictions, freshness, missing data, confidence, invalidation, and monitor-next near the decision surface.

Every AI output remains inspectable through run IDs, thesis IDs, signal IDs, source timestamps, payload drawers, and timeline events.

Use research language: Run research, Watch, Review, Record decision, Scenario active, Invalidation risk.

Do not add order execution, broker integration, fake PnL, Sharpe, alpha, annualized returns, or guaranteed language.

daily close

TARGETS

108k

then 112k

Evidence and contradictions

near decision

Supporting evidence

Regime is trending and bullish. Volume profile shows accumulation above prior value area. News risk is known and not immediately negative.

Contradicting evidence

Funding/OI is crowded. Late longs are fragile if price loses entry zone. Onchain secondary data is missing.

Missing or stale data

Optional onchain NVT and exchange flow metrics unavailable in this run.

Monitor next

Funding reset, CVD confirmation, reclaim above resistance, invalidation approach.

Scenario radar

3 branches

High

Pullback holds above 100.8k with funding reset. Suggested action: review long thesis.

Medium

Price chops between entry and target without CVD confirmation. Suggested action: watch.

Invalid

Daily close below 98.4k. Suggested action: invalidate thesis and record outcome.

Decision journal

manual

Watch

Accept

Reject

Notes: waiting for funding reset and spot CVD confirmation.

Outcome review

due later

Record hit target, invalidated, mixed, expired, or unknown. This feeds retrospective reliability and future research context.
